Ho Chi Minh City, Vietnam (+84) 70 354 7179

SUMMARY

Software Engineering student with hands-on full-stack experience, focused on Laravel backend development. Independently designed and shipped two production-style applications — an e-commerce platform and a hotel management system — covering RESTful API design, layered architecture (Repository & Service pattern), transactional data integrity, and role-based access control. Comfortable working solo end-to-end but eager to adapt to Agile/Scrum workflows, code review culture, and Git collaboration in a real engineering team.

SKILLS

Languages	PHP, JavaScript, HTML, CSS
Frameworks & Libraries	Laravel (Blade), Vue 3, Pinia, Tailwind CSS
Databases	MySQL, PostgreSQL
Architecture & Concepts	RESTful API, OOP, SOLID, Repository & Service Pattern
Tools & Environment	Git, Docker, GitHub Actions (CI/CD), PHPUnit, Laragon
Soft Skills	Technical English (Proficient in reading documentation
code commenting)	

EDUCATION

Sai Gon University 2023 - 2027 (Expected)
GPA: 3.21/4.0 — Undergraduate Student in Software Engineering

PROJECTS

ECOMFASHION - Fashion E-commerce Platform 01/2026 - Present
Full-stack Developer
Stack: Vue.js 3, Tailwind CSS, Laravel 11, MySQL, Docker
GitHub: `https://github.com/MynameNghia123/Ecom-Fashion`
Live Demo: `https://ecom-fashion.onrender.com`

- Designed ∼**122 RESTful API endpoints** with a **layered architecture** (Repository & Service pattern).
- Applied eager loading at the Repository layer to prevent N+1 queries, and used **database transactions** with pessimistic locking (`lockForUpdate`) to prevent overselling during checkout.
- Built a **custom RBAC engine** spanning 14 modules with per-staff **direct permission overrides**, enabling fine-grained access control beyond simple role checks.
- Integrated **two payment gateways** (VNPay, SePay) with IPN/webhook verification, alongside COD, and implemented a **5-state return-request workflow** (pending → approved → received → refunded) with auto payment-status updates.
- Secured a shared **Laravel Sanctum** layer for both the Admin and Customer SPAs, and containerized the stack with **Docker Compose** (5 services, incl. a local Mailpit SMTP catcher).

Hotel Management Web Application 03/2026 - 05/2026
Backend Developer
Stack: Laravel (Blade), TailwindCSS v4, Vite, MySQL, Gemini API
GitHub: `https://github.com/MynameNghia123/Hotel-Management`
Live Demo: `https://hotel-management-arp7.onrender.com`

- Implemented a strict **Repository & Service architecture** with a session-based booking cart, and benchmarked eager loading against N+1 queries: cut Booking List from 22→6 queries (−73%) and Room Search from 9→3 (−67%), with query count staying constant as data volume scales.
- Built a hotel management schema with **no hard-coded limits** on floors, room types, or rooms (demoed with 5 floors, 4 room types, 13 rooms — all fully configurable via the admin UI), delivered as a **server-side rendered (SSR)** app with ∼76 RESTful endpoints on a Laravel Blade + TailwindCSS v4 stack, optimized via Vite.
- Built an **extensible RBAC system** allowing new roles to be created via the admin UI, with granular per-module permissions (demoed with 4 roles: Admin, Receptionist, Technician, Accountant), and integrated an **AI-powered chat assistant** (Gemini API) with prompt caching and throttle middleware (OTP: 3 req/min, chat: 30 req/min).
- Covered core booking/payment flows with **automated tests (PHPUnit)**, set up a basic **CI/CD pipeline**, and deployed a live demo on Render.
